TTS – Table-Top-System (source: laservision)

TTS - Laser safety for optical tables by laservision

Flexible, easy and safe

Laser setups on optical tables require special protective measures due to their experimental character. With the TTS laser protection system for optical tables (TTS - Table-Top-System) laservision offers an all-around solution adapted to the use with optical tables and breadboards. This is based on the E25 Modular Barrier System with FlexJoint. Awarded with the German-Design Award (2021) in the category "Special" laservision offers with the "On-The-Table System" joint for any positioning angle which can be positioned freely and at the same time stable on the table. The "Foldable-Edge System" also provides a 180° folding solution equipped with magnets. In the "Basic System" you can choose between screwed or magnetic posts. The possibility of exchanging the certified wall material for laser safety windows, thus providing additional insight without loss of safety, is also worthy of special mention. As all components are certified according to EN 60825-4, this results in a flexible safety solution that complies with the standards at all times.

Your sales contacts at LASERVISION GmbH & Co. KG are at your disposal at any time for more details and questions about windows, customer-specific productions and availability.

As one of the leading manufacturers of laser safety products, laservision develops, manufactures and sells laser safety goggles, small filters and cabin windows based on various plastics and mineral glass types, as well as laser safety curtains and large-area laser protection (partition walls and cabins). Eye protection products are CE certified and correspond at least to the applicable standards EN207 / 208.
